Abstract. The abstract should briefly summarize the contents of the paper in 15–250 words. Test citation [Berners-Lee2001]

Keywords: First keyword · Second keyword · Another keyword.

1 Research Questions

Are knowledge graph embeddings helpful in predicting entity classes?

2 Empirical Semantics

With the help of your tutor, provide a definition for Empirical Semantics that applies to the perspective that your team is taking for this problem. Probably, this will be one of the last things you will do...

3 Introduction

[1 Page]

Explain your perspective on the problem of Empirical Semantics. Give both the intuition and motivate, by relying on use cases and examples, why this perspective is important. Briefly describe what is the state of the art and how you're pushing it with your contribution. Also mention what data and methods you use in your work. Conclude by clearly stating what is your contribution.

4 Related Work

[1 Page]

List the main relevant work (a bullet list is ok) and for each of them write a paragraph describing (i) the key contribution of the related work, (ii) how your contribution relates/differentiates from it.

* Technical report of the task force 42 from ISWS 2022 led by Heiko Paulheim.

5 Resources

[1 page]

Our use-case focusses on DBpedia categories (why?). A category in DBpedia has a type of *skos:Concept*. There are more than 2 million categories in DBpedia. We manually selected 13 categories (motivation?) for our experiment. For every category, we manually selected predicate-object pairs that represent and distinguish a category. For example, the pair "author"-*"Stephen_King"* was chosen as an indicative of the category *"Novels_by_Stephen_King"*. For six categories, more than one predicate-object pair was selected.

Three datasets were retrieved from DBpedia with SPARQL-queries: 1. Getting the number of subjects with the same predicate and object for every category. Criteria: (1) predicates are in the DBpedia ontology, (2) predicates not referring to Wikipedia (not containing the word "wiki" in their names). For example, there are 44 objects with predicate "author" and object *"Stephen_King"* in the category *"Novels_by_Stephen_King"*. This predicate-object pair is the most frequent in the category and it is indicative for the category. The purpose of this dataset is to calculate the frequency of the predicate-object pairs in every category (ranking) and calculate reciprocal rank. The overview of the selected categories, their indicative object-predicate pairs and ranks is presented in ?? . Refer to the SPARQL-query. 2. Getting all triples for every category. Criteria: (1), (2), and (3) objects with URI containing "http://dbpedia.org/resource/" to filter out objects with literal values. This dataset is used for evaluation. Refer to SPARQL-query. 3. Getting all combinations of subjects and predicate-object-pairs in a category. Criteria: (1), (2), (3). Refer to SPARQL-query.

6 Proposed approach

[2 pages]

Describe your proposed method.

7 Evaluation and Results: Use case/Proof of concept - Experiments

[2 pages]

Show here that your proposed approach addresses your research questions or how you intend to show it. This can be done by either or both:

- Describing an experimental setting design, including research hypotheses, methods and metrics of measurements
- Describing a proof of concept/use case, based on real data, that support your claim

Table 1. DBpedia categories selected for experiment

Category URI	Predicate	Object	N objects	Rank	Reciprocal rank
Novels_by_Stephen_King	author	Stephen_King	44	1	
Swedish_death_metal_musical_groups	genre	Death_metal	61		
	hometown	Sweden	22

8 Discussion and Conclusions

[1 page]

Identify strengths and weaknesses of your proposal, discuss lessons learned: what are the key issues you have encountered or that you think should be taken into account to develop your proposal/experiments, and what are possible ways to address them.
